Neurol. 436:167-181(2001).
FUNCTION: Functions as a receptor for membrane-bound ligands Jaggedl, Jaggedl, and Deltal to requiate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TISSUE SPECIFICITY.

c.i. PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TW) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

-:- PTM: Phosphorylated (By:similarity).

-:- PTM: Phosphorylated (By:similarity).

-:- SIMILARITY: CONTAINS 3 EGF-LIKE DOMAINS.

-:- SIMILARITY: CONTAINS 2 LINYONTCH REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright.                 apoptotic programs. May play an essential role in postimplantation development, probably in some aspect of cell specification and/or differentiation (By similarity).

SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                         bonds (By similarity).

SUBCELLUIAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.

TISSUE SPECIFICITY: Highly expressed in the spheen and choroid plexus in the brain. Expressed in postnatal central nervous system (CNS) germinal zones and, in early postnatal life, within numerous cells throughout the CNS. It is more highly localized to ventricular germinal zones. Also found in the heart, liver and

```
terminal iragament N(EC) which are probably linked by disulline bonds (By similarity).

1. SUBCELUIAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus. SIGNES SPECIFICITY: Expressed in the brain, heart, kidney, lung, skeletal muscle and liver.

2. FRM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(FW) and a N-terminal fragment N(EC). Following Ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

2. SIMILARITY: BELONGS TO THE NOTCH FAMILY.

2. SIMILARITY: CONTAINS 35 EGF-LIKE DOMAINS.

2. SIMILARITY: CONTAINS 2 LIN/NOTCH REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TMP-alpha converting ensyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presently dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TISSUE SPECIFICITY: Expressed in the brain, kidney and spleen. Expressed in postnatal central nervous system (CNS) germinal zones and, in early postnatal life, within numerous cells throughout the CNS. Found in both subventriclar and ventricular germinal zones. DEVELOPMENTAL STAGE: In the embryo, highest levels occur between days 12 and 14 and decrease rapidly to much lower levels in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Comp. Neurol. 436:167-181(2001).

- FINCTION: Functions as a receptor for membrane-bound ligands Jagged1 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RRB-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). Acts instructively to control the cell fate determination of CNS multipotent progenitor cells, resulting in astroglial induction and neuron/oligodendrocyte
                                                                                                                                                                                                                                       "Notch! and Notch3 instructively restrict bFGF-responsive multipotent neural progenitor cells to an astroglial fate."; Neuron 29:45-55(2001).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             bonds (By similarity).

```

```
-: SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.
-: ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be produced by alternative splicing.
-: TISSUE SPECIFICITY: Highly expressed in the brain, lung and thymus. Expressed at lower levels in the spleen, bone-marrow, spinal cord, eyes, mammary gland, liver, intestine, skeletal muscle, kidney and heart.
-: DEVELOPMENTAL STAGE: First detected in the mesoderm at 7.5 d.p.c. By 8.5 d.p.c. highly expressed in presonitic mesoderm, mesenchyme and endothelalum. Between 9.5-10.5 d.p.c. expressed at high levels in the neuroepithelium. At 13.5 d.p.c. expressed in the surface ectoderm, eye and developing whisker follicles.
-: PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a criminal fragment NITM) and a Neterninal fragment (RCC). Following ligand binding, it is cleaved by TNN-alpha converting enzyme (TACE) to yield a membrane associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. T. Genome sequence and comparative analysis of the solvent-producing
T. bacterium Clostridium acetobutylicum.";
J. Bacteriol. 183:823-4838(2001).
J. Bacteriol. 183:823-4838(2001).
J. Bacteriol. 183:823-78030 A hairpin structures. These structures
can inhibit DNA replication and are intermediates in certain DNA
recombination reactions. The complex acts as a 3'-5' double
strand exonuclease that can open hairpins. It also has a 5'
single-strand endonuclease activity (By similarity).
J. SUBUNIT: Heterodimer of SDCC and SDCD (By similarity).

- 1- FUNCTION: MUSCLE CONTRACTION.
- 1- SUBDNIT: MUSCLE CONTRACTION.
- 1- SUBDNIT: MUSCLE CONTRACTION.
- 1- SUBDNIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2 HEAVY CHAIN SUBDNITS (MHC), 2 ALKALI LIGHT CHAIN SUBDNITS (MLC)
- AND 2 REGULATORY LIGHT CHAIN SUBDNITS (MLC-2).
- 1- SUBCELLUAR LOCATION: Thick filaments of the myofibrils.
- 1- DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.
- 1- PTW: TWO CYSTERINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKTATED AND ARE RESIDUED FOR MYOSIN ATPASE ACTIVITY.
- MISCELLANBOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (LAM) AND 1 HEAVY MEROMYOSIN (LAM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED COLORS.

Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by Thr-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is the notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PTM: Phosphorylated (Verebral are associated with CADASIL (Cerebral DISEASE: Defects in NOTCH3 are associated with CADASIL (Cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy) which causes a type of stroke and dementia of which key features include recurrent subcortical ischemic events

"Splice site mutation causing a seven amino acid Notch3 in-frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            apoptotic programs (By similarity).
SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide

    bonds (By similarity).
    SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.
    TISSUE SPECIFICITY: Ubiquitously expressed in fetal and adult.

                        Strong clustering and stereotyped nature of Notch3 mutations in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -:- SIMILARITY: BELONGS TO THE NOTCH FAMILY.
